# Working With Search

Updated on May 23, 2025

Focus Listen

On the Sirion mobile application, you can quickly search the entities, contract documents, and non-contract documents. You can perform a comprehensive text-based search for all the contract and non-contract documents while excluding the documents present in the archived and inactive contracts.

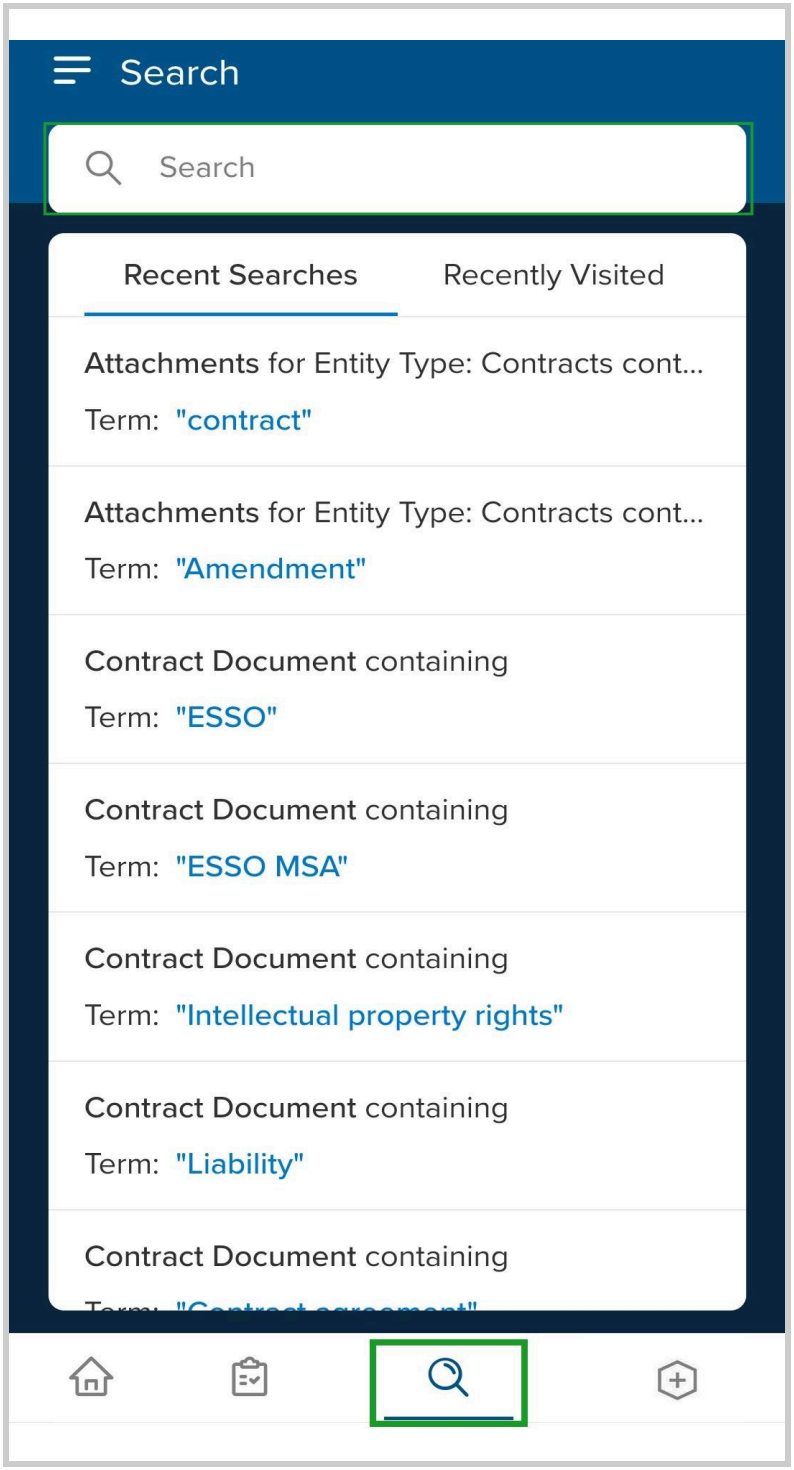

The Search page contains the following two tabs:

- **Recent Searches:** It displays the list of recently searched items
- **Recently Visited:** It displays the list of recently visited entities

## How to Use Search

Perform the following steps to use the search:

1. Click the **Search** ( ) icon present at the bottom of the application.
2. Enter a search query in the **Search** text box.

# Types of Search

Search is case-insensitive feature, that is, if you enter text in the Search box, the following suggestions are displayed:

- Entity Id
- Contract Documents
- Attachments

# Search Query

You can use different operators to make your search results more precise. These operators are supported in both Contract Documents and Attachments searches.

## Search Operators

Different search operators used in Sirion are described in the subsequent sections:

### Boolean Operators

The following operators are used in the Boolean search:

- AND (&&)
- OR (||)
- PLUS (+)

Examples,

| Search | Use Case | Search Query |
|---|---|---|
| Metadata | To search a contract whose title contains **Manufacturing**, **Service Agreement** anywhere in the title | • "Manufacturing" && "Service Agreement"<br>or<br>• "Manufacturing" AND "Service Agreement" |
| Attachments | To search attachments that must contain term **Returns** at least once but the term **Business** may or may not be present | Business +Returns<br>**NOTE** - No space after the + operator |

### Wild Card Operators

Wild cards are used to search for single and multiple characters. The following wild card operators can be used in a query syntax:

- Use "?" for a single character
- User "*" for multiple characters

Examples,

| Search | Use Case | Search Query |
|---|---|---|
| Contract Documents | To search text which ends with "**ind**" present in the contract document | ?ind |
| Attachments | To search text which starts with **test** | Test* |

### Proximity Operators

Proximity search looks for terms that are within a specific distance from one another.

Examples,

| Search | Use Case | Search Query |
|---|---|---|
| **Contract Documents** | To perform a proximity search, add the tilde character ~ and a numeric value to the end of a search phrase. For example, to search for "**apache**" and "**jakarta**" within **10** words of each other in a document | "jakarta apache"~10 |

### Fuzzy Operators

Fuzzy search searches for terms that are like terms.

Examples,

| Search | Use Case | Search Query |
|---|---|---|
| Contract Documents | To search for results which are like the term **agree**. This search will match terms like **free** and **tree**. It will also match the word "**agree**" itself | agree~ |

## Special Use Cases

With support for the above query syntax, the following use cases can be handled:

| Search | Use Case | Search Query |
|---|---|---|

| | | |
|---|---|---|
| Contract Documents | Search contract documents having either of the terms **Confidentiality Termination** AND **Security** | (Confidentiality OR Termination) AND Security |
| Metadata Search | Search Action entity having phrase **Risk Financial** in description | "Risk Financial" |

## Invalid Search

In case you enter an invalid search query, which the search engine is unable to understand, an error message will be displayed.

For example, if you search for '**Agreement'** in the Title field during the metadata search, a Notification dialog box with the following text appears:

"*Invalid Query: Your search query has incorrect syntax for <Field Name>, Please fix and re-try.*"

While in case of an invalid search query for contract documents and attachments search, the text appears:

*"Invalid Query: Your search query has incorrect syntax, Please fix and re-try".*
